

Cyberian Frontier is a Web services company specializing in supporting advertising agencies, design firms, and independent marketing professionals. With over 15 years of experience in the marketing industries Cyberian Frontier understands the unique and time-critical needs associated with producing professional strategic communications. All coding is done by hand. We're strongly proficient in HTML, Javascript & CSS and moderately proficient with PHP & Perl. We also have several years experience building custom applications with MivaScript.

Our greatest strength lies in our experience working with graphics & hand-coding html interfaces. Most of our contemporary works render nearly identically across different platforms and browsers. We also spend a fair bit of time creating custom interface templates for open source and commercial applications.

Cyberian Frontier offers a full line of hosting solutions based on Verio's VPS hosting. At present we are operating 24 VPS servers (1, 2, & 3) and we're managing hosting and email for about 140 domains. We've used Verio as our sole source of hosting services since 2000.

We're a big fan of open source software and we've been successfully deploying open source applications for our clients for over 3 years now. We have a fair bit of experience with Plone (Zope), phpWebSite, vTiger, Gallery, CRELoaded, OSCommerce, phpList, Mojo Mail, eGroupware, and passing familiarity with many other open source applications.

We strongly believe that all corporations have a responsibility to be a good citizen and a good neighbor. So we actively support a number of community-focused and non-profit organizations by offering all our services at half price to groups and endeavors that serve to *make the world a better place*. We also offer pro-bono hosting to several non-profit groups.

Our office is solar powered. With today's concerns over global warming, rising energy prices, and our dependence upon foreign energy sources we have decided that seeking energy independence and sustainability is the best course of action to secure our financial future and remain a stable, dependable partner to our clients. We also believe its the right thing to do for the environment. And in February Cyberian Frontier is launching a new line of hosting that's purely solar powered via an off-the-grid data center in California. So far the response to this new product has been greater than expected and we anticipate that within a few years half of our websites will be powered by the sun.

Our new endeavor will be launched in February under the name **Green Power Web** (<http://GreenPowerWeb.com>).
